技术规格

Background:	The modification of proteins with ubiquitin is an imp ortant cellular mechanism for targeting abnormal or short-lived proteins for degradation. Ubiquitination in volves at least three classes of enzymes: ubiquitin-act ivating enzymes, ubiquitin-conjugating enzymes, and ubiquitin-protein ligases. This gene encodes a memb er of the E2 ubiquitin-conjugating enzyme family. Thi s enzyme is required for post-replicative DNA damag e repair, and may play a role in transcriptional regul ation. Mutations in this gene are associated with me ntal retardation. Alternative splicing results in multiple e transcript variants.
